

surgery such as mole removal. The power output of the hyfrecator is ten times higher than that of the Bono-Technique! Consequently, tiny scars often form when using the hyfrecator to remove telangiectasia. Certainly you don't want to exchange your tiny blood vessels for scars. Unfortunately, some doctors are unaware of the Bono-Technique and still use the hyfrecator!

What about laser?

One of the most exciting inventions in medical technology is the laser. Laser is effective for removing large birthmarks ("port wine stain"), but is not recommended for most common vascular blemishes. Although effective, laser often coagulates too much surrounding skin and causes post-operative marking, bruising and, in rare cases, scarring. Furthermore, laser treatments are extravagantly expensive compared to the Bono-Technique!

What else should I know?

To give you some idea of the success and cost of your treatment, our technician will consult with you and inspect the blemishes you wish removed. If you only have a few vascular blemishes, treatment time will only be a few minutes. The treatment process will be clearly explained during the consultation. Advice will also be given to avoid new vascular blemishes. *Please phone us for a consultation.*

Most blemishes are removed in one to three treatments. Each treatment takes a few minutes.

Treatments are not very painful: most people experience only slight discomfort.

The blood vessel usually vanishes immediately after the treatment.

There is some redness and swelling after the treatment. The area looks normal within a few hours. A tiny crust (nearly invisible) will form.

*All instruments (needles) are sterile and disposable; **you are absolutely safe!** You may be referred to a physician to rule out disease; however, nearly all cases are environmentally caused.*

"Broken Capillaries" and "Spider Veins"

***A simple, inexpensive
procedure for removal of
unwanted vascular blemishes***

Bono-Blend Technique™

Vascular Blemishes . . .

Vascular blemishes are commonly called “broken capillaries” or “spider veins,” and can take many different forms. The medical name for these unsightly vessels is Telangiectasia. The cluster of capillaries under the eye or on the nose, the “blood dot” on the upper lip, the vessels on the side of the nose, neck or upper chest, are all forms of vascular blemishes.

Unfortunately, most people live their entire lifetime not knowing these disfiguring blemishes can be easily and safely removed. Now, using the Bono-Technique, these marks can be removed in minutes!

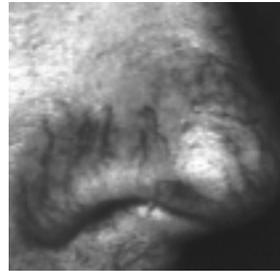

What causes these blemishes?

There are many different causes of vascular blemishes, but the single greatest cause is heredity. Fair-skinned people are prone to develop vascular blemishes. Aging, excessive sun or cold exposure, wear and tear on the skin and trauma (such as an abrasion) can cause the condition. Improper blackhead extraction is a common injury that causes telangiectasia.

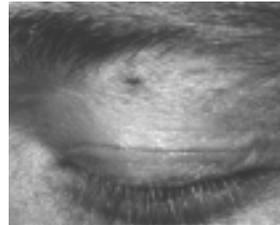

Does alcohol cause the condition?

Surprisingly, medical research does not include moderate alcohol consumption as a common cause. But some research shows that certain diseases cause vascular blemishes. Be assured, however, that *nearly all cases of telangiectasia are not disease-related, but simply a matter of the environment.*

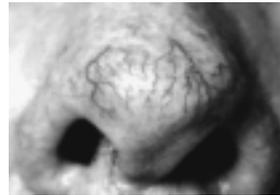

Affordable Treatment . . .

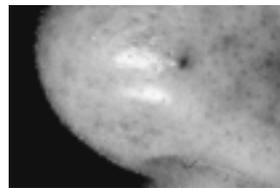

Common telangiectasia.

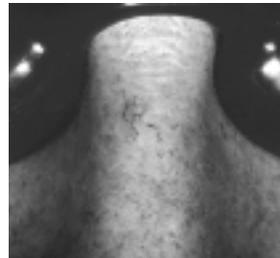

"Birthmark" angioma.

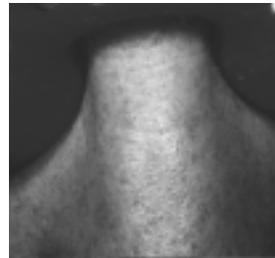

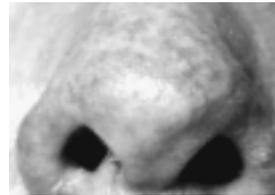

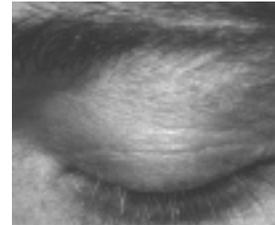

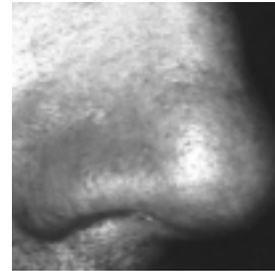

Telangiectasia on the nose.

Injury induced telangiectasia on a 17-year-old girl (nose).

Common hereditary telangiectasia.

A Simple, Proven Technique . . .

What is the treatment?

Amazing as it seems, the Bono-Technique has been used for over 25 years to remove vascular blemishes! It is a safe and proven method. In practice, a tiny "electric" needle coagulates the vessel. The vessel "drys-up" and is eliminated. Scarring or marking after treatment almost never occurs.

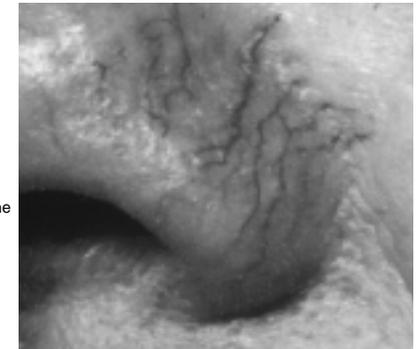

Should my regular doctor remove these blemishes?

Unfortunately, most doctors use an instrument called a hyfrecator to remove vascular blemishes. This is a very powerful instrument used for many applications of electro-

Below, you see the results of only one treatment. When vessels are close together, we recommend removing about half the blood vessels at the initial appointment.

Before:

Initially, about half of the vessels are removed.

After:

Five weeks after the first treatment, about half the vessels are gone.
